

RDF for Semantic Interoperability

**A subgroup of the HL7 ITS work group, working jointly with the
W3C Healthcare and Life Sciences group**

[David Booth, Hawaii Resource Group](#)

Claude Nanjo, Cognitive Medical Systems

Eric Prud'hommeaux, W3C

January 2015 – San Antonio

RDF for Semantic Interoperability

- Subgroup of HL7 ITS
- Working jointly with W3C Healthcare and Life Sciences group
- Formed in October 2014
- Weekly teleconference
- Agenda page:
http://wiki.hl7.org/index.php?title=ITS_RDF_ConCall_Agenda

Mission

- Establish semantic interoperability of structured healthcare information
- Using RDF and related standards to express machine-processable meaning

=> Increase the effectiveness and efficiency of healthcare delivery

Each standard is an island

RDF and OWL are semantic bridges between standards

Major goals

- Create **RDF and OWL definitions** of healthcare information standards
 - Enable semantics to be uniformly interpreted in RDF
- Act as a **knowledge resource** for other work groups

Why RDF?

- See <http://dbooth.org/2014/why-rdf/>

"Captures information content, not syntax"

"Multi-schema friendly"

"Allows diverse data to be connected and harmonized"

"Allows data models and vocabularies to evolve"

"Good for model transformation"

"Supports inference"

Why RDF (in general?)

RDF graph

Why RDF as a Universal Healthcare Exchange Language?

A Roadmap for Healthcare Information Interoperability

Work projects

- Current:
 - FHIR ontology
 - PhUSE-FDA project (formerly CDISC2RDF)
- Proposed:
 - Bridging VA, Intermountain and other models
 - Use Cases
 - ICD-11 and SNOMED
 - C-CDA RDF representations
 - High-level concept mapping to RDF (AR typeCodes, etc.)

FHIR RDF / Ontology Deliverables

- Mappings between FHIR XML/JSON and FHIR RDF, for lossless conversion of FHIR instance data
- Ontology describing FHIR RDF

FHIR RDF / Ontology Status

- Requirements drafted
- Reviewed four independently developed approaches (Cecil Lynch, Josh Mandel & Eric Prud'hommeaux, Claude Nanjo, Tony Mallia)
 - Fifth approach also under consideration: JSON-LD
- Goal is to converge on a single approach, then standardize

QUESTIONS?

Planning the road ahead

- Priorities? FHIR first, then what?
- How can we be most effective?
 - How can we best support other groups wanting to use RDF?
 - Collect RDF guidelines? E.g.:
 - Using RDF and OWL instead of UML?
 - How to express ordering in RDF?
